Cadence Financial AI Architecture Whitepaper

Executive Summary
This technical paper presents the mathematical foundations of our zero-leakage redaction pipeline. The design ensures deterministic guarantees across all ingested media formats.

Core Principles:
1. Zero false negatives through defense-in-depth detection.
2. Reversible tokenization with AES-GCM-256 cryptographic isolation.
3. Automated audit logging of all transformation operations.

Section 2: Formal Verification of State Transitions

State machine transitions obey strict monotonic invariance.
Any failed verification immediately aborts the release pipeline under fail-closed policies.
